The Golden Cycle

Icosahedral Shells

Grow a solid in shells, every layer sitting exactly on the one below, and the solids of five-fold symmetry come back to themselves, a golden ratio larger each time. This book follows those cycles exactly: the icosahedron and the dodecahedron as endless shells of each other; six solids nesting, every layer filled by a few repeated pieces; the same cycle turned inside out, and seeded by DICTO's twin solids, the Hecatodihedron and the Ogdoecontahedron; and one rule, each corner giving the next face, that grows the shells step by step and closes the cycle.

The full turn of twelve stations is a gnomon: it adds exactly what makes the next icosahedron the same shape as the first. Every solid is exact in numbers built from the golden ratio, and every nesting and volume is checked with remainder zero.

DICTO is an artist in Osaka, Japan, with a background in architectural sculpture, stonecarving and Buddhist statuary. He builds geometric sculpture from recycled PET bottles with his own modular systems, B1NR and DICTOspheres.
