Where today's work goes

DICTO · 4 November 2026 · internal tracker (not for publication) · source: The DICTO Concordance, section destinations_2026_11_04

Rule (consolidation plan, 4 Nov): every new result becomes a chapter in its thread's volume and goes out in the weekly batch; a standalone record only for a major theorem (DICTO's call). Every attempt is logged in the Concordance ledger, so only open possibilities are ever retried.

1. Chapters for the volumes (weekly batch)

Space-Fillers and Lattice Moves (new volume)	• Truncated tetrahedra that fill space: Dehn-zero family = T ∩ (2(−T)+t); 12/12 tile; mirror-pair construction (research open: proof) • Admiral network: no kind fills alone (Dehn) • Method appendix: general Dehn screen (calibrated)
Centre Pyramids (to finish)	• Dehn screen on the tetrahedron sweep picks exactly the known tiler (β-tin, Damasceno–Engel–Glotzer 2012) • RT pyramids result (overnight, waiting)
HexOct: The Hexagonality Law (next version)	• h-pieces Dehn-zero from λ = 5/24 • fixed h-piece (λ ≥ 3/8) tiles alone; Mahler exactly 34/3 • harmonic scan: no silence; 5/24 jump is a corner-set artefact
The Golden Ladder (in progress)	• Roundness law μ = √n (Lindelöf) on cube ∩ cross sweeps; tetra-sweep and Delian roundness also Lindelöf • Tetra-sweep Mahler exact; 4D sweep IQ/Mahler • Seven golden Dehn-zero truncated tetrahedra
#94 v2 (weekly batch)	• CORRECTION: √3 roundness = Lindelöf, not a coincidence • sweep measures table update
Alicia in Wonderland (Queens, next version)	• Outside link: 600-cell icosians = Poincaré dodecahedral space group; mode counts match to k = 120 • 600-cell slices: IQ, Mahler, Dehn
OG family (new volume)	• OG family: Dehn nonzero (none tiles alone); IQ and Mahler table
DICTONIC Bonds (next version)	• Delian walk O(t): Dehn nonzero for t > 0; roundness max = Lindelöf point
The DICTO Concordance v2	• tests × families grid complete (n/a where outside competence) • ledger of every attempt

2. Research still open (not ready to publish)

- Proof of the truncated-tetrahedra conjecture (real-cut check running: verify-real.log)
- h-pieces alone for 5/24 ≤ λ < 3/8
- Identity / prior art of the fixed h-piece
- RT pyramids overnight → aperiodic clue checklist
- n = 8 golden approximants (satper-2 running)

3. Watch list (no claim)

- Aperiodic 3D monotile clue checklist (Tsiokos 2026 preprint read)
- Outside leads 2–5: meteorite quasicrystals, C60 in space, cosmic web foam, dense-star crystals

4. New books

none needed now; if the truncated-tetrahedra conjecture is proved it may merit a standalone record (major theorem: DICTO's call)
