The DICTO Concordance

A map and almanac of the work: threads, names, concepts and the one triangle

DICTO (artist, Osaka, Japan) · contact@dictospheres.com · https://dictospheres.com · ORCID 0009-0001-2620-2036
4 November 2026 · version 1 · DICTO DOI: 10.5281/zenodo.23934363 (concept) ·
Licence CC BY-SA 4.0 · Compiled with Claude (Anthropic) from the papers, the site cards and the DICTOnary, generated from concordance.json by build.py
The work, its ideas and its names are DICTO's, as each paper's credit line says; this map only gathers them.

> *This is a map of DICTO's work in one place, so that no detail has to be carried in the head.* ***Threads*** *follow one idea from paper to paper;* ***Names*** *lists every named solid, piece, family and rule with who named it and where it first appears; the* ***Almanac of Concepts*** *says in plain words what each operation, law and method is and where it is used; the last page puts every thread on the one triangle of mirrors. To find anything, look it up in Names or the Almanac and follow the paper numbers.*

1. Threads

10 threads run through the papers. Each paper is listed, in the order of its number, with one line on what it adds to the thread; a paper can sit on several threads. Lines marked → are the verified cross-links of the audit of 4 November 2026 (study 2026-11-04-cross-links, section A).

1.1 Kepler, Euclid and the stars

Euclid's dodecahedron as a cube with six roofs, all five Platonic solids in one cubic cell, and the jewels and stars that fill its gaps.

- **#8** The Euclid–Kepler–Pacioli Cell: all five Platonic solids nest on 13 points in one periodic cell: Euclid's roofs, reflected back through the cube, land on an icosahedron.
- **#10** DICTO Jewel (EKP windows): finding: the DICTO Jewel, with 12 Penrose rhombus windows; with stella octangulas it fills space.
- **#12** Star Chain Reaction: finding: great star, Sunstar, great star, Sunstar, nested exactly, each step touching.
- **#13** The DICTO Dodeca-13: the 13-dodecahedron cluster made solid: its gaps closed by 30 wedges and 20 needles.
- **#14** The DICTO-Star: an icosidodecahedron, 12 dodecahedra and 20 tridiminished icosahedra closing exactly at every edge.
- **#15** DICTO Jewel clusters: finding: four and six DICTO Jewels as clusters, each filling space with stella octangulas.
- **#16** Sunstar clusters: finding: six dodecahedra round a Dogstar, a Sunstar turned inside out.
- **#17** Kagome Hulls: in the Stella–Jewel and Sunstar lattices, hull-shaped clusters share pieces corner to corner as in the Kagome and pyrochlore nets.
- **#18** The DICTO Hexa: eight exact Jewels passing through each other make one solid, the DICTO Hexa.
- **#38a** The DICTO Kepler–Poinsot–UP Cycle: great and small stellated dodecahedra alternate round the icosahedron in an endless cycle, $\times\varphi^3$ in length each turn.
- **#41** The DICTO Jewel: the Jewel proved exactly (volume 3/16), with the Jewel-Tetra, Jewel-Octa and Jewel-Rhombi as single solids.
- **#42** The DICTO Sunstar: Hart's Dogstar proved exactly (volume $\varphi/2$): dodecahedra and Dogstars fill space; the Sunstar clusters named.

- **#59** The Icosaxes Hexa: Bloom, Bud and Seed: the Hexa move with icosahedral symmetry: twenty Icosaxes close into the Icosaxes Bloom, Bud and Seed.
  → #8 → #38a: the nesting I(1) ⊂ GSD ⊂ D(φ) of #38a is the EKP cell nesting of #8 (cross-links audit, row 12).

1.2 The golden cycles

Endless nests of icosahedral solids that repeat φ^3 larger each turn, every layer filled by a few exact pieces.

- **#19** AXE, CLEO and FUJI: AXE, CLEO and FUJI close the thirteen-icosahedron cluster into one icosahedron of edge φ^2; FUJI is new.
- **#20** The FUJI Family: FUJI as one member of a family of pyramids on truncated triangles; Cleo-Icos with Antonius, a space-filling pair from the golden rhombohedron.
- **#22** The Chain of Karma: the icosahedron and the dodecahedron filled exactly as shells of each other, alternating without end.
- **#23** Spheres of Dharma: an exact endless nesting of six icosahedral solids, each layer filled by a few repeated pieces.
- **#24** The Bodhi Seed: a rhombic triacontahedron holding twelve smaller ones and one at its centre, with the Lotus seed's counts and ratios.
- **#27** Capturing the In-betweens: the in-between stages as solids, among them the DICTO Truncated-Icosahedral Hecatodihedron.
- **#28** The DICTO Hecatodihedron: the 102-faced seventh stage of the Spheres of Dharma.
- **#29** Theaetetus: the hollow DICTO-ICOSA star, its loose core held by Cleo-Icos, grown to the Hecatodihedron.
- **#32** Inverted Shells: The Spheres of Dharma Turned Inside Out: polar reciprocation turns the cycle inside out and reverses every nesting; the Ogdoecontahedron appears.
- **#33** Double Vision – Both Cycles in One Space: both cycles in one space: they share solids on two spheres, never both, because the settings differ by 3, not a power of φ.
- **#34** Progenitors: the twins H and O alone never close on a power of φ (8,742 tight cycles); set into the Spheres of Dharma they close a nine-station golden cycle.
- **#35** Vajrayana: the dodecahedron returns as the hull of the Cleo star, and the loose steps of the cycle are filled.
- **#35a** The DICTO Metaxyhexecontahedron: the solid in the last gap of the golden cycle.
- **#35b** The DICTO Palintriacontahedron: the icosidodecahedron's pyramids flipped out at full height, bridging one turn to the next.
- **#38** Universal PiTet: the growth rule T: from the icosidodecahedron a four-step cycle through the rhombic triacontahedron and the DICTO GTI.
- **#54** One Turn Is a Gnomon: what each step of one turn adds (the Julias and Pimentels); no piece shape repeats at another size.
- **#78** The Truncated Icosahedron Star (TI Star): the truncated icosahedron's pyramids turned outwards start a golden cycle of their own.
- **#91** Four-Dimensional Solids Whose Every Cell Is a Golden Cut (draft): draft: 119 D·I Golden Tight Cycles close at φ, all through golden-cut stations.
  → #34 → #91 (+ #35, #33): the same tight-cycle criterion; none of #34's 8,742 cycles closes on a power of φ, while #91's golden-cut stations give 119 at φ (row 7).

1.3 OG, the Ogdoecontahedron family

The DICTO Ogdoecontahedron (OG), polar of the Hecatodihedron, with its packings, its relatives up and down, and its place in the octet.

- **#30** A Fibonacci Spine: five body-centred packings of OG set in five wedges round a five-fold axis, every copy at a golden height.
- **#31** The DICTO Ogdoecontahedron: OG: the polar of the Hecatodihedron, 20 regular hexagons and 60 kites, named for its 80 faces.

- **#31a** The DICTO OCD Stella: the hull of the golden adapter pieces round one OG, cut along its 8 joints: the OCD Stella.
- **#34a** The DICTO Hecatogdoecontahedron: the Hecatodihedron and OG interlocked as one self-dual compound with 182 faces and 182 corners.
- **#36** Golden Bodhi Pyrochlore: the 22.57% gap of the OG packing: its exact pieces, the limbs, the GBPC and the Bull-horns adaptor.
- **#37** The DICTO Ogdoecontahedron on the Octet Truss: OG's eight hexagons lie on the faces of the octet's octahedra: four exact space-filling kits.
- **#37a** The DICTO Ogdoecontahedron on the Gyrated Octet: OG in the gyrated octet: the layers are twins by the spinel law; the DBT and the DICTO OTT.
- **#39** The DICTO OG Family: four steps up (rule T) and four down (rule P) from OG: KRE, PHE, TPP, DPHP and TPH, TQH, TQP, TQHD.
- **#40** The DICTO OG Family on Every Stacking: one kit builds the OG family into every c/h stacking, the Fibonacci crystal included.
- **#43** DICTO Kyushindo Cores: every icosahedral solid S lies inside $(15 - 6\sqrt{5})\cdot P(S)$; DICTO's OG turned out is nested at every beat.
- **#80** The Gains of DICTO's Growth Rule: OG's chain under T passes the KRE, PHE, TPP and DPHP, then Hamlet and Ophelia, and does not close.
- **#91** Four-Dimensional Solids Whose Every Cell Is a Golden Cut (draft): draft: OG = $H(\mu TI) \cap \varphi^2 D^*$, and the Lesser and Greater Golden OG at the golden levels.

1.4 Space-fillers and lattice moves

Single solids and mixtures that fill space, made exactly by moving a lattice, by thirteen-cell blocks or by a kit of connectors.

- **#1** DICTO skewed rhombic dodecahedron: finding: a space-filler of 60° and 72° rhombi, and its two elongated forms.
- **#5** Regular-hexagon elongated dodecahedron: finding: the regular-hexagon elongated dodecahedron, found independently (known: Grünbaum, 2010).
- **#11** The stretched dodecahedron: finding: the dodecahedron stretched along a cube-face axis.
- **#25** DICTO Spheroid-13 RD: a rhombic dodecahedron with its twelve face neighbours fills space by translation alone; DICTO's rounded block.
- **#26** DICTO ATOM-13×13: thirteen polyhedral thirteens side by side, six golden and seven periodic.
- **#45** The Reuleaux Platonic Solids: balls on the corners of all five Platonic solids, as one family: the width theorem.
- **#47** Every Mix of the Platonic Solids Fills Space: every mix of the Platonic solids fills space, with one kit of seven connectors.
- **#49** The Polyhedral Stretching Theorem: a dodecahedron slid one edge-length sweeps an equal-edged solid: the DICTO stretched solids.
- **#50** One Move Each: classical cut-and-glue space-fillers built exactly by one setting of Kaleidohedra's three lattice moves.
- **#93** One Double Pyramid, Two Splits: every caesium chloride pair and every Delian pair except the octet fills space in one way only.

1.5 Bonds

Two kinds of point and one sliding weight: space shared out as pairs of convex pieces, and the web of the faces they share.

- **#48** The Golden Split: icosahedra, Unborns and AXE become two convex space-fillers, Icosaxes and Unborn Axes, at the golden point.
- **#51** The Delian Bond: the octet cut by one sliding plane: from rhombic dodecahedra to cubes, with Samson and Delilah at equal volume.
- **#52** The Web of Bonds: each loop is one fixed crowd of points and one weight; the web of bonds is the weighted Delaunay web.

- **#53** The Global Web of Bonds: the weight walked through ten crystal networks; named tilings at the stops.
- **#55** David and Goliath: the A15 stop at 3/4: Goliath is the hull of Jessen’s icosahedron, David a small tetrahedron.
- **#56** Sonsam and Lahdeli: the Delian bond on the twinned octet (Sonsam and Lahdeli); keys change the pieces, never the network.
- **#57** The Rule of Halves: on every stacking each hole's piece is borrowed, whole or in halves, from the two pure stackings.
- **#58** From the Octet to Every Stacking: the Web of Bonds: the series told in plain words, from the octet to every stacking.
- **#93** One Double Pyramid, Two Splits: the bonds' pairs are rigid: each tiles only as its own crystal (Theorems A, B).

  → #51, #53 → #86: #86’s member A cubes (λ = 3/8) of edge 1/√2 are #51’s cube end; member B (λ = −1/8) is the octet switch (row 9).

1.6 Stackings and the Hexagonality Law

Close-packed layers stacked cubic (c) or hexagonal (h) in any order, and the exact laws every stacking obeys, tested on real crystals.

- **#40** The DICTO OG Family on Every Stacking: the tetrahedral–octahedral honeycomb stacks in c/h words, as close-packed crystals do.
- **#57** The Rule of Halves: the Rule of Halves: tetrahedral pieces whole from the nearest layer, octahedral pieces as two halves.
- **#58** From the Octet to Every Stacking: the Web of Bonds: series paper ending in the Rule of Halves.
- **#60** DICTO Janus c/h Pyrochlore: the same rule on the pyrochlore network of diamond-like crystals.
- **#61** The Swap Rule: squashed layers make every piece a Janus piece (Ganesha); the two mixed pieces add up to the two pure ones.
- **#64** The Swap Rule in Crystals: the Swap Rule holds in all 299 testable cases of four crystal families.
- **#66** The Focus: the Hexagonality Law: each kind of piece totals a straight line in the share of hexagonal layers.
- **#67** Random Stackings and Stacking Faults: the law holds for any stacking, faulted or random.
- **#68** Real Polytypes and the Hexagonality Law: in the ANNNI model a property is a line in h exactly when J2 = J3 = 0; silicon carbide data.
- **#69** The Hexagonality Law and the Fibonacci Stacking: the Fibonacci stacking: hexagonal share exactly $1/\varphi^2$, so φ enters the volumes of a crystal.
- **#70** The Hexagonality Law in Real Materials II: entropy and enthalpy under pressure.
- **#71** The Hexagonality Law in Real Materials III: hydrogen sites in titanium and zirconium.
- **#72** The Hexagonality Law in Real Materials IV: Pauling's third rule and Goldschmidt's tolerance factor measured by h.
- **#73** The Hexagonality Law in Real Materials V: ice, diamond and III–V semiconductor nanowires.
- **#74** Spin Ice and Kagome Magnets on Every Stacking: spin ice and kagome magnets on every stacking.
- **#75** HexOct: Two Tiles for Every Stacking: HexOct: only two layer tiles, c and h, build every stacking.
- **#83** HexOct: Knitting Crystals: one plane slices every stacking into a knitting chart.
- **#84** The Window Law: the Window Law: the Hexagonality Law beyond one layer; the Swap Rule is the condition to stay on the line.
- **#86** The HexOct Family: one tower move joins the c-tile; five single-solid tile pairs, A to E.
- **#92** Aristotle's Pyramid in Layers: the face-to-face tilings by the octet’s pyramids are exactly the stackings of octet layers.

  → #69 → #91 (+ #30): #91’s golden-tilt Fibonacci word is #69’s c → ch, h → c (share $1/\varphi^2$) (row 10).
  → #67 → #73: #73’s ice I_sd value uses #67 Theorem 1 on random stackings (row 11).

1.7 Pyramids, Stars and Vacuus

Cut a solid from its centre into one pyramid per face; then fill space with the pyramids, turn them outwards into stars, or keep only the walls between them.

- **#44** Aristotle's Pyramid: of the five Platonic face pyramids only the cube's alone, or the tetrahedron's with the octahedron's, fill space.
- **#65** The Red Queen 120-cell: all five face pyramids are the cores of the regular four-dimensional solids seen in perspective.
- **#77** Face to Face: A New Law of Aristotle's Pyramids: in face-to-face tilings the pyramids round each apex make up their whole solid.
- **#78** The Truncated Icosahedron Star (TI Star): pyramids turned outwards: the TI Star, its Star Halo, and an endless cycle.
- **#79** Star Cores of DICTO's Solids: the star treatment for DICTO's solids; the pole rule always works; DICTO's valley rule.
- **#80** The Gains of DICTO's Growth Rule: the gains of DICTO's growth rule T found exactly: T is polar reciprocation of the inverted corners.
- **#81** Core Cycles: when the cores of DICTO's star chains alternate: the core turn alternates for every solid whose faces lie in two families of planes.
- **#85** Eccentric Pieces: an edge of dihedral angle δ keeps its valley open through step k only if $(k + 1)\delta \leq 360°$.
- **#87** DICTO Vacuus Solids: keep only the walls between the pyramids: the Vacuus, built as SHEETS and STRUTS.
- **#92** Aristotle's Pyramid in Layers: the octet's pyramid tilings layer by layer, settling the question #77 left open.
- **#92** Aristotle's Pyramid in Layers: version 2: the cuboctahedron's pyramids (regular tetrahedra and half-octahedra) tile as the stackings with a free cut in every octahedron, rebuilding the cuboctahedron on straight layers and the anticuboctahedron on twisted ones.
- **#93** One Double Pyramid, Two Splits: the cube's and the rhombic dodecahedron's centre pyramids: one double pyramid, split across its square into cube pyramids that build only cubes, or along a free diagonal on every square into rhombic dodecahedron pyramids that never close into a cube; #77's law fails for the rhombic dodecahedron.

  → #77 → #92 (+ #40, #57; #51/#86): #77's main theorem is #92's reduction; #92 answers what #77 left open (row 1).
  → #43 → #80, #78, #79, #81 (+ #90, #91): #80's gains $(R/r)^2 = 9, 3, 15 - 6\sqrt{5}$ are #43's constants; #43 Lemma 3 is #80's "T is polar reciprocation" (row 2).
  → #85 → #87: #85's angles $\delta = \alpha + \alpha'$ are the angles of #87's Vacuus fins (row 13).

1.8 The four-dimensional queens

The regular four-dimensional solids, above all the 600-cell (the White Queen) and the 120-cell (the Red Queen): their slices, shadows and the path between them.

- **#62** Shadows of the Fourth Dimension: shadows and slices of the four triangle-built four-dimensional solids: deltahedra of two new kinds.
- **#63** The White Queen 600-cell: a complete exact atlas of the 600-cell's slices in its four main directions; Humpty Dumpty.
- **#65** The Red Queen 120-cell: the 120-cell built exactly from the White Queen; 124 slice patterns.
- **#76** Between the Queens: the five uniform stages between the queens, by cutting the White Queen's corners deeper.
- **#89** All Five Golden Pairs Are Slices of Four-Dimensional Solids: the golden pairs as slices of the tesseract, the 120-cell, the 24-cell and the rectified tesseract.
- **#91** Four-Dimensional Solids Whose Every Cell Is a Golden Cut (draft): draft: DICTO All-Golden Polytopes in the tesseract family and in the 600-cell × 120-cell family.

  → #76 → #91: the three uniform μ of #91's 600 × 120 sweep are #76's edge-equalising cuts (row 3).

1.9 The golden cuts

Cut every corner of a solid by the same amount so that every face keeps the golden ratio: where such cuts exist, and where they live.

- **#20** The FUJI Family: FUJI and its family stand on truncated triangles.
- **#48** The Golden Split: the Icosaxes and the Unborn Axes appear, at the golden point of the AXE.
- **#88** Every Platonic Solid Has Exactly Two Golden Cuts: exactly two golden cuts for each Platonic solid; the octahedron's pair is the Icosaxes and the Unborn Axes, which fill space.
- **#89** All Five Golden Pairs Are Slices of Four-Dimensional Solids: all five pairs are slices of four-dimensional solids, the cubes only in the rectified tesseract; beyond Plato golden cuts are rare.
- **#90** Golden on the Octahedron, Silver on the Cube: Six Dimensions and the Golden Cut Cubes (draft): draft: the field obstruction: the Golden Cut Cubes need $\sqrt{2}$ with $\sqrt{5}$; they are Galois twins.
- **#91** Four-Dimensional Solids Whose Every Cell Is a Golden Cut (draft): draft: four-dimensional solids whose every cell is a golden cut.
- **#94** The Silent Golden Station: golden and bronze ratios as the zeros of the cubic harmonics on the sweep.

1.10 The cube–octahedron sweep

One slider from the octahedron through the cuboctahedron to the cube, met as a weight walk, a polar pair, a six-dimensional section and a four-dimensional path.

- **#48** The Golden Split: the golden network: Icosaxes and Unborn Axes as the two pieces of one sliding pair.
- **#52** The Web of Bonds: the golden loop is the power diagram of the body-centred cubic sites with one sliding weight.
- **#53** The Global Web of Bonds: the caesium chloride (CsCl) and rock-salt lanes of the weight walk.
- **#54** One Turn Is a Gnomon: Theorem B: the polar of the Icosaxes is a cube with six pyramids of height $1/\varphi$.
- **#81** Core Cycles: when the cores of DICTO's star chains alternate: the core turn on $S(\mu) = P \cap \mu P^*$ is an involution.
- **#89** All Five Golden Pairs Are Slices of Four-Dimensional Solids: DICTO's filling by cut cubes and octahedra, a section of the rectified tesseractic honeycomb.
- **#90** Golden on the Octahedron, Silver on the Cube: Six Dimensions and the Golden Cut Cubes (draft): draft: the sections of cube × octahedron sweep from the octahedron through both golden pairs to the cube; cut = shadow picks $\mu = \varphi$.
- **#91** Four-Dimensional Solids Whose Every Cell Is a Golden Cut (draft): draft: $S(\mu) = P \cap \mu P^*$; all ten golden cuts lie on the three sweeps D·I, C·O and T·T.
- **#94** The Silent Golden Station: the harmonic fingerprint of the sweep: the cubic tone Q4 is silent only at Icosaxes ($\mu = \varphi$), whose corners are two icosahedra; Q8 also at the bronze station $(\sqrt{13} - 1)/2$.

  → #53 → #91 (+ #52): the 24-cell honeycomb sliced vertex-first is #53's rock-salt lane, cell-first the CsCl lane (row 4).
  → #81 → #91, #90: #81's core turn on $S(\mu)$ is $\nu \mapsto (R/r)^2/\nu$; on C·O $\mu \mapsto 3/\mu$, beside the CsCl partner $\mu \mapsto 3 - \mu$ (row 5).
  → #54 → #90, #91: #54 Theorem B is the polar side of the C·O sweep; the rhombic dodecahedron is H(2) (row 6).
  → #53 → #89: DICTO's cut-cube and octahedra filling (#89 §7) is #53's CsCl lane (row 8).

2. Names

217 entries, alphabetical (a leading “DICTO” is passed over in the order). “Named by” is taken from the paper's credit line or text; “see #N” means the text read for this draft does not say who chose the name; “placeholder” marks a name waiting for DICTO's choice. First: the paper or finding (F) where the name first appears; D: the number in the DICTOnary.

3. Almanac of Concepts

42 concepts: operations, constructions, laws, theorems and methods, as distinct from the named shapes. Each definition is taken from the wording of the paper cited; then the first paper and its date, the papers that use it, its threads, and who proposed it.

c/h stacking words. Each layer sits on the one below as in the octet (c) or as its mirror image (h); any word in c and h is a stacking (#40).

First: **#40** The DICTO OG Family on Every Stacking (20 October 2026) · Used in: #57, #58, #60, #61, #64, #66, #67, #74, #83, #84, #86, #92 · Threads: Stackings and the Hexagonality Law; OG, the Ogdoecontahedron family · Proposed: Jagodzinski's notation (classical); taking the OG family to every stacking was proposed by Claude and adopted by DICTO (#40)

core turn (core cycle). The solid common to the hulls of the tips of each family of faces; for the truncated icosahedron it alternates, and two turns give it back (#81).

First: **#78** The Truncated Icosahedron Star (TI Star) (current version 3 November 2026) · Used in: #81, #90, #91 · Threads: Pyramids, Stars and Vacuus; The cube–octahedron sweep · Proposed: DICTO found it for TI (#78) and proposed it for every two-family solid (#81)

cut equals shadow. Asking the cut to equal the shadow of a lattice orbit selects $\mu = \varphi$, where the roots of D6 cast the Icosaxes point for point (#90).

First: **#90** Golden on the Octahedron, Silver on the Cube: Six Dimensions and the Golden Cut Cubes (draft) (draft, 4 November 2026) · Used in: — · Threads: The cube–octahedron sweep; The golden cuts · Proposed: see #90

Dehn invariant (counting). A polyhedron that tiles space has Dehn invariant zero; #44 makes a Dehn-type count on dihedral angles rigorous with the Splitting Theorem of Conway, Radin and Sadun.

First: **#22** The Chain of Karma (current version 20 October 2026) · Used in: #36, #37, #37a, #38, #38a, #44 · Threads: Pyramids, Stars and Vacuus; The golden cycles · Proposed: classical (Dehn; Debrunner)

Delian bond. The cut of the octet's double cones at which the two solids have the same volume: the tetrahedron's has doubled and the octahedron's halved (#51).

First: **#51** The Delian Bond (24 October 2026) · Used in: #52, #53, #56, #85, #92 · Threads: Bonds · Proposed: DICTO proposed the approach and named Samson and Delilah; doubling is the ancient Delian problem (#51)

DICTONIC SOLIDS and BONDS. The six convex and keyed solids of #48 and #51, held in three bonds (#51).

First: **#51** The Delian Bond (24 October 2026) · Used in: #52, #53 · Threads: Bonds · Proposed: DICTO (names, #51)

EKP construction. Put Euclid's six roofs on a cube and reflect the roof corners back through the cube faces: they land on a regular icosahedron inside (#8).

First: **#8** The Euclid–Kepler–Pacioli Cell (current version 20 October 2026) · Used in: #17, #18, #41, #42, #79 · Threads: Kepler, Euclid and the stars · Proposed: DICTO's construction (#8)

face-to-face reduction. In every face-to-face tiling by face pyramids, the pyramids round each apex make up their whole solid (#77).

First: **#77** Face to Face: A New Law of Aristotle's Pyramids (30 October 2026) · Used in: #92 · Threads: Pyramids, Stars and Vacuus; Stackings and the Hexagonality Law · Proposed: DICTO proposed the face-to-face case (#77)

Fibonacci stacking. Layers c and h in the never-repeating order of c → ch, h → c; the hexagonal share is exactly $1/\varphi^2$ (#69).

First: **#40** The DICTO OG Family on Every Stacking (20 October 2026) · Used in: #69, #83, #84, #91 · Threads: Stackings and the Hexagonality Law; OG, the Ogdoecontahedron family · Proposed: joint work (#40)

field obstruction. The Golden Cut Cubes need $\mathbb{Q}(\sqrt{2}, \sqrt{5})$, so no point set with coordinates in $\mathbb{Q}(\sqrt{5})$ holds a similar copy of one (#90).

First: **#90** Golden on the Octahedron, Silver on the Cube: Six Dimensions and the Golden Cut Cubes (draft) (draft, 4 November 2026) · Used in: — · Threads: The golden cuts; The cube–octahedron sweep · Proposed: see #90

gnomon. The piece which, added to a figure, makes a whole of the same shape, only larger (Euclid, Heron) (#54).

First: **#54** One Turn Is a Gnomon (25 October 2026) · Used in: #66, #78 · Threads: The golden cycles · Proposed: classical; DICTO's idea to carry it into his three-dimensional golden cycle (#54)

golden cut. Cutting every corner of a solid equally so that each face becomes a truncated polygon with its sides in the golden ratio φ (#88).

First: **#88** Every Platonic Solid Has Exactly Two Golden Cuts (current version 3 November 2026) · Used in: #89, #90, #91 · Threads: The golden cuts; The cube–octahedron sweep · Proposed: DICTO's observation of the 3-fold hexagon in his solids; the solids and family names are DICTO's (#88)

golden cycle. An exact, endlessly repeating nesting of icosahedral solids, each layer filled by a few repeated pieces, growing by φ^3 each turn (#22, #23).

First: **#22** The Chain of Karma (current version 20 October 2026) · Used in: #23, #24, #32, #33, #34, #35, #54, #78, #91 · Threads: The golden cycles · Proposed: DICTO's (#22, #23)

golden split. Cut each AXE into four little pyramids from one inner point and give each to the piece it touches; at 1/φ along its axis nothing sticks out (#48).

First: **#48** The Golden Split (23 October 2026) · Used in: #51, #52, #59 · Threads: Bonds; The golden cuts · Proposed: DICTO: pieces without odd protrusions, cuts "hemispherical, or anywhere in between" (#48)

growth rule T. Every corner v of a solid gives the face plane $v \cdot x = v \cdot v$, through v and at right angles to the line from the centre; T(S) is the solid these planes bound (#39).

First: **#38** Universal PiTet (current version 20 October 2026) · Used in: #39, #43, #78, #79, #80, #81, #91 · Threads: The golden cycles; OG, the Ogdoecontahedron family; Pyramids, Stars and Vacuus · Proposed: DICTO's growth rule (#80); T is the 3D form of the classical antipedal construction (#38 v3)

Hexagonality Law. In every stacking each kind of piece totals exactly what its layers hold in their own pure stackings, a straight line in the share of hexagonal layers (#66).

First: **#66** The Focus (current version 28 October 2026) · Used in: #67, #68, #69, #70, #71, #72, #73, #74, #75, #83, #84, #90, #91 · Threads: Stackings and the Hexagonality Law · Proposed: DICTO's law (#84)

HexOct layer tiles. The tile of a layer is its share of space, four pieces; only two tiles, c and h, occur in any stacking (#75).

First: **#75** HexOct: Two Tiles for Every Stacking (current version 29 October 2026) · Used in: #83, #86 · Threads: Stackings and the Hexagonality Law · Proposed: DICTO's idea and name (#75)

Janus c/h pieces. Octahedral pieces with one cubic and one hexagonal half, looking into one stacking above and the other below (#57).

First: **#57** The Rule of Halves (26 October 2026) · Used in: #58, #60, #61, #64, #66, #67, #74, #83 · Threads: Stackings and the Hexagonality Law · Proposed: DICTO (name, #57)

Kagome hull test. Group cells into hull-shaped clusters and ask whether any two share at most one piece and every shared piece lies in exactly two (#17).

First: **#17** Kagome Hulls (current version 20 October 2026) · Used in: #18, #41, #42, #59 · Threads: Kepler, Euclid and the stars · Proposed: DICTO's test (#17)

keys and dents. A key or a dent moves small pieces from one solid to its partner; keys change the pieces but never the network (#54, #56).

First: **#37** The DICTO Ogdoecontahedron on the Octet Truss (current version 20 October 2026) · Used in: #48, #51, #54, #56, #57, #58, #59, #75 · Threads: Bonds; OG, the Ogdoecontahedron family · Proposed: DICTO (keyed glue, #37; keyed versions of the new pairs, #56)

knitting slice. One plane, perpendicular to a row of touching balls, cuts every tetrahedron into an isosceles triangle and every octahedron into a rhombus, a chart to knit (#83).

First: **#83** HexOct: Knitting Crystals (current version 1 November 2026) · Used in: — · Threads: Stackings and the Hexagonality Law · Proposed: DICTO proposed the idea (#83)

lattice moves. A shear of the lattice, the equal-edged cell and a stretch rebuild classical space-fillers in one setting (#50).

First: **#50** One Move Each (23 October 2026) · Used in: — · Threads: Space-fillers and lattice moves · Proposed: Fedorov's moves (1885); DICTO's idea that they rebuild the cut-and-glue fillers (#50)

polar reciprocation. Replace each solid by its polar reciprocal: the nesting of a cycle reverses (#32).

First: **#32** Inverted Shells: The Spheres of Dharma Turned Inside Out (current version 20 October 2026) · Used in: #33, #34, #38, #43, #54, #80, #87, #91 · Threads: The golden cycles; OG, the Ogdoecontahedron family; Pyramids, Stars and Vacuus; The cube–octahedron sweep · Proposed: classical; turning the cycle inside out by it was DICTO's idea (#32)

polyhedral stretching. Slide a solid in a straight line and take the shape it sweeps through (#49).

First: **#49** The Polyhedral Stretching Theorem (22 October 2026) · Used in: — · Threads: Space-fillers and lattice moves · Proposed: DICTO (the stretched dodecahedron, F11, #49)

pyramidise (centre pyramids). Split a solid whose centre lies inside every face plane into its centre pyramids, one cone from the centre over each face (#44, #87).

First: **#44** Aristotle's Pyramid (21 October 2026) · Used in: #65, #77, #78, #79, #81, #85, #87, #92 · Threads: Pyramids, Stars and Vacuus · Proposed: Aristotle's pyramid (classical); DICTO proposed pyramidise as one operation on any such solid (#87)

Reuleaux construction. A ball on every corner of a Platonic solid, radius the solid's diameter; the body is what all the balls share (#45).

First: **#45** The Reuleaux Platonic Solids (21 October 2026) · Used in: #87 · Threads: Space-fillers and lattice moves · Proposed: DICTO's idea (#45)

reverse step P. The step back: take as new corners the foot points of the face planes, the points of those planes nearest the centre (#39).

First: **#39** The DICTO OG Family (20 October 2026) · Used in: #43, #80 · Threads: OG, the Ogdoecontahedron family · Proposed: DICTO proposed running the rule the other way (#39)

Rule of Halves. A tetrahedral gap takes the piece of the pure stacking of its nearest layer; an octahedral gap's piece is two halves, from the layers above and below (#57).

First: **#57** The Rule of Halves (26 October 2026) · Used in: #58, #60, #61, #64, #66, #67, #69, #72, #74, #75, #83, #84, #85, #86, #92 · Threads: Stackings and the Hexagonality Law; Bonds · Proposed: DICTO (#84 credit); DICTO's idea to follow the web onto every stacking (#57)

shadow forms. Other ways of breaking up the same space, to find new pieces (#48).

First: **#48** The Golden Split (23 October 2026) · Used in: #51 · Threads: Bonds · Proposed: DICTO's idea (#48)

spinel twin law. Twinning on an octahedron-face plane by a half-turn about ⟨111⟩; for OG the twin is OG turned 60° (#37a).

First: **#36** Golden Bodhi Pyrochlore (current version 20 October 2026) · Used in: #37a, #40 · Threads: OG, the Ogdoecontahedron family; Stackings and the Hexagonality Law · Proposed: classical crystallography

Splash Rules. Look for one simple rule behind a whole family of exactly computed values (#84).

First: **#61** The Swap Rule (current version 27 October 2026) · Used in: #84 · Threads: Stackings and the Hexagonality Law · Proposed: DICTO, 27 October 2026 (#84)

Star and Star Halo. Turn a solid's face pyramids outwards and it becomes a star; the tightest skin round the tips is the star's halo (#79).

First: **#78** The Truncated Icosahedron Star (TI Star) (current version 3 November 2026) · Used in: #79, #80, #81, #85 · Threads: Pyramids, Stars and Vacuus; The golden cycles · Proposed: DICTO's idea (#78); the name Star Halo is DICTO's

Swap Rule. The two mixed pieces always add up to the two pure ones (#61).

First: **#61** The Swap Rule (current version 27 October 2026) · Used in: #64, #66, #67, #69, #72, #74, #84 · Threads: Stackings and the Hexagonality Law · Proposed: DICTO (name, #61)

the sweep S(μ) = P ∩ μP*. The flats y = x/μ of the product P × P* of a solid and its polar cut out P ∩ μP*; every corner cut of P or P* is such a section (#91).

First: **#90** Golden on the Octahedron, Silver on the Cube: Six Dimensions and the Golden Cut Cubes (draft) (draft, 4 November 2026) · Used in: #91 · Threads: The cube–octahedron sweep; The golden cuts · Proposed: DICTO proposed cube × octahedron as the six-dimensional home of the pair (#90) and following each solid with its dual through the dimensions (#91)

tight cycles. Nestings in which every step is tight; one that closes at a power of φ is a DICTO Golden Tight Cycle (#34, #91).

First: **#34** Progenitors (current version 20 October 2026) · Used in: #91 · Threads: The golden cycles · Proposed: see #34; the name DICTO Golden Tight Cycles is DICTO's (#91)

tower move. Moving one tower of the c-tile by one lattice step along its own layer joins the towers along a face (#86).

First: **#86** The HexOct Family (3 November 2026) · Used in: — · Threads: Stackings and the Hexagonality Law · Proposed: DICTO proposed true simple pieces (#86)

truncated triangle. A hexagon with all six angles 120° and sides alternating between two lengths; the regular hexagon is the case of equal sides (#88).

First: **#20** The FUJI Family (date to check) · Used in: #88, #89, #91 · Threads: The golden cuts · Proposed: classical face; DICTO observed that it runs through his solids (#88)

Vacuus: SHEETS and STRUTS. Keep only the walls between the centre pyramids, a fin O–A–B for each edge; built as SHEETS (the fins) and STRUTS (a rod from the centre to every corner, with the edges) (#87).

First: **#87** DICTO Vacuus Solids (3 November 2026) · Used in: — · Threads: Pyramids, Stars and Vacuus · Proposed: DICTO's idea and name (#87)

valley rule. Shorten each spike just enough to clear its neighbours: the ridges keep full spikes and the valleys flatten (#79).

First: **#79** Star Cores of DICTO's Solids (current version 1 November 2026) · Used in: #85 · Threads: Pyramids, Stars and Vacuus · Proposed: DICTO's rule (#79)

web of bonds. Draw one line, a bond, between every two pieces that share a face; the lines make a web, the classical weighted Delaunay web (#52).

First: **#52** The Web of Bonds (25 October 2026) · Used in: #53, #56, #57, #58 · Threads: Bonds · Proposed: DICTO's idea, 25 October 2026 (#52)

weight walk (power cell). Each piece is the region nearer, in a weighted sense, to its own point than to any other; one number, a weight given to one kind of point against the other, slides (#52, #53).

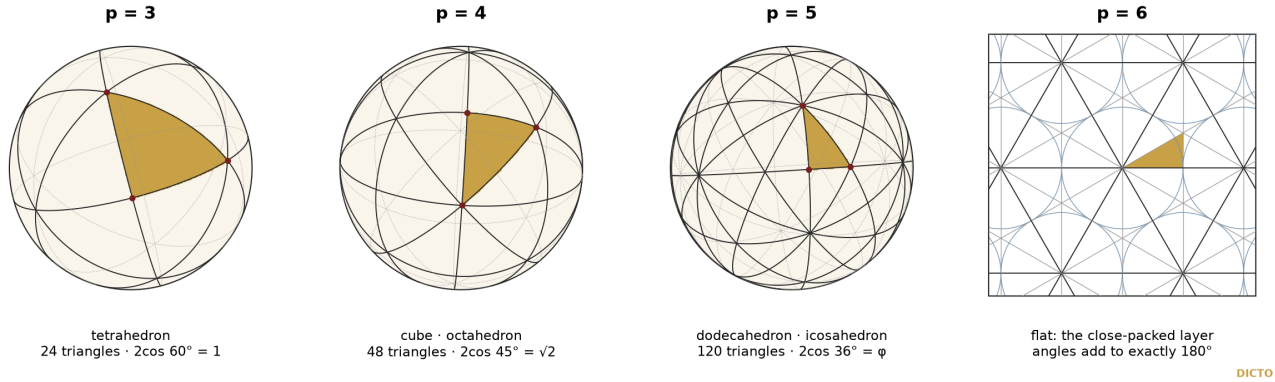

First: **#52** The Web of Bonds (25 October 2026) · Used in: #53, #55, #56, #57, #58, #60, #61, #64, #66, #67, #69, #75, #86, #90, #91 · Threads: Bonds; Stackings and the Hexagonality Law; The cube–octahedron sweep · Proposed: power diagrams are classical (Aurenhammer); DICTO's two loops read this way (#52)

Window Law. Anything fixed by g consecutive layers has a mean that is linear in the shares of the c/h words of length g (#84).

First: **#84** The Window Law (1 November 2026) · Used in: — · Threads: Stackings and the Hexagonality Law · Proposed: DICTO's idea (#84)

4. The Singularity: One Triangle

The Golden Ladder, chapter 1 (One Triangle, Three Numbers, draft of 4 November 2026) shows that the five Platonic solids come from three kaleidoscopes, the spherical triangles with angles 90°, 60° and 180°/p for p = 3, 4, 5, and that each carries one number, 2 cos(180°/p): φ for the dodecahedron and icosahedron (p = 5), √2 for the cube and octahedron (p = 4), 1 for the tetrahedron (p = 3). At p = 6 the triangle is flat and tiles the plane under the close-packed layer of balls, the setting of the stacking papers. The table places each thread by its number world and by the dimensions its papers reach.

The (2, 3, p) triangle for p = 3, 4, 5 on the sphere and p = 6 in the plane, with the number 2 cos(180°/p) of each (figure 1 of The Golden Ladder, chapter 1).

Thread	Number world	2D	3D	4D	6D	8D	From
Kepler, Euclid and the stars	φ (p = 5), on the cube		●				Euclid's cube with roofs; the Dogstar ties the cube to the dodecahedron (ch. 1 §4)
The golden cycles	φ (p = 5)		●	●			icosahedral nests ×φ³; Lotus seed centres = 600-cell vertex and neighbours (#22); #91 draft
OG, the Ogdoecontahedron family	φ (p = 5); flat (p = 6) in #40		●		●		OG in Q(√5); OG as section and hull of the six-dimensional product (#91 draft)
Space-fillers and lattice moves	1, √2 and φ		●				all five solids and their mixes (#47)
Bonds	√2 (p = 4), φ in the golden loop	●	●				octet and cube (#51); icosahedra (#48); three plane networks (#53)
Stackings and the Hexagonality Law	flat (p = 6); φ in the Fibonacci stacking	●	●				close-packed layers; share 1/φ² (#69)
Pyramids, Stars and Vacuus	1, √2 and φ		●	●			T + O and cube pyramids (#44); TI Star (#78); pyramids as cores of 4D solids (#65)
The four-dimensional queens	φ (p = 5)		●	●			600-cell and 120-cell, numbers a + b√5 (#63)
The golden cuts	1, √2 and φ	●	●	●	●	●	c_n = 2cos(180°/n) (#88); 4D (#89); Z6 and E8 → H4 (#90 draft)
The cube–octahedron sweep	√2 (p = 4), golden stations		●	●	●		C·O sweep; rectified tesseract (#89); cube × octahedron (#90 draft)

The golden cuts reach furthest, to the E8 lattice in eight dimensions (#90); OG and the cube–octahedron sweep reach six (#90, #91). The flat triangle (p = 6) carries the stackings, where φ enters through the Fibonacci stacking (#69). The placement is the compiler's reading of the papers named in the last column.

5. What Is Missing

> *Parts 1–4 hold what we know. This part holds what we do not: gaps inside the work, the open points the papers left, and, from other fields, results we did not know of that bear on ours. DICTO's point: the Concordance, the reference library and the Kaleidohedra engine together are the tool. Each entry is to carry three legs, the map (threads and papers it touches), the source (a library copy) and the engine (a view or test in the app); a missing leg is itself a gap (draft 2 carries the library leg for the outside finds; the engine leg follows), and each outside find moves from to read to credited, tested, and finally ours.*

5.1 The grid: solids against operations

Papers where each operation is done for each solid; — marks a gap, ? an unsure entry. PYR centre pyramids and their tilings · STAR Star and Star Halo · VAC Vacuus · GC golden cut · SWP polar sweep P ∩ μP* · NEST nesting and golden cycles · TWIN Galois twin (Double Vision) · CH c/h stackings · DEHN Dehn count · 4D four-dimensional lift or slice.

Solid	PYR	STAR	VAC	GC	SWP	NEST	TWIN	CH	DEHN	4D
Dodecahedron	44, 65	35, 78, 80	87	88, 89	91	22, 23, 33, 34, 91	33, 38a	—	22, 44	65, 89, 91
Icosahedron	44, 65	78, 80	87	88, 89	91	19, 22, 23, 38a, 91	33, 38a	—	22, 44	63, 65, 89, 91
Cube	44, 65, 93	80, 81, 87	87	88, 89, 90	90, 91	8, 91	90	86 (?)	44	65, 89, 90, 91
Tetrahedron	44, 77, 92	80, 81	87	88, 89	91	8, 91	—	40, 57–75, 92	44	65, 89, 91

Rhombic triacontahedron	—	38, 80	87	89	station only	23, 24, 38, 91	33 (?)	—	38 (?)	—
Icosidodecahedron	35b (star)	38, 80	87	golden-regular only (89)	station only	23, 38, 91	33 (?)	—	—	63, 89

5.2 The nearest gaps, ranked, inside and outside

Ranked by how directly each follows from what is already proved (DICTO: most of the calculations are already done; the rest is arrangement and interpretation). DICTO's observation: the gaps inside the work are directly analogous to the gaps outside it, so it is one study. Each gap therefore names the outside work that bears on it (5.5); a gap with none is where to search outside next.

1. **The cuboctahedron's centre pyramids**. Why near: its circumradius equals its edge, so its pyramids are regular tetrahedra and half-octahedra, the pieces #92 classified; #77's reduction applies directly (settled face to face on 4 November 2026: #92 version 2, §5). Leads to: a third member beside #92 and #93. Outside: *none found yet: a search target*.
2. **The second dual sweeps, cuboctahedron–rhombic dodecahedron and icosidodecahedron–triacontahedron**. Why near: #91 proves P ∩ μP* holds every corner cut, so #89's golden rhombic cuts must sit on these sweeps. Leads to: the next rung of the dual ladder; tight cycles through the rhombic solids. Outside: C. Wild et al. … J. Phys.: Condens. Matter 36 (2024) 045303.

3. **The reversed neighbour (#92 open point 1, #93 open point 1)**. Why near: the same local question for the tetrahedron pyramid and the cube pyramid; one argument may close both. Leads to: every tiling falls into whole solids, settling #44 for all tilings. Outside: M. Goldberg … Discrete Comput. Geom. 37 (2007).
4. **#91 Lemma 6 exact**. Why near: #76's exact constructions are the stations needed (cross-link). Leads to: #91's 600 × 120 result as a theorem. Outside: T. Denney et al. … Canad. Math. Bull. 28 (1985) 385.
5. **#43 Conjecture 2 (octahedral constant 3)**. Why near: #80's gain 3 and #81's involution $\mu \mapsto 3/\mu$ give the same constant. Leads to: an octahedral twin of #43 Theorem 2. Outside: *none found yet: a search target*.
6. **The Hexagonality Law for the Laves big atom (#66, #67)**. Why near: #84 shows the Swap Rule is the condition to stay on the line; check it on the three-layer window. Leads to: the last exception of the law explained. Outside: T. J. McLarnan … Rep. Prog. Phys. 45 (1982) 587.
7. **Star and Star Halo of the classical solids**. Why near: the census scripts exist and #80 has the gains. Leads to: a full map of known and new stars and halos. Outside: *none found yet: a search target*.
8. **Galois twins of every golden cut**. Why near: #88 and #89 give the depths in closed form; only their minimal polynomials are needed, as in #90. Leads to: a Double Vision column for every golden pair. Outside: M. Freedman et al. … Phys. Rev. B 85 (2012) 045414; K. A. Adiprasito … Invent. Math. 199 (2015) 581.
9. **Dehn counts of the rhombic dodecahedron, cuboctahedron, triacontahedron and icosidodecahedron pyramids**. Why near: #44's counting carries over. Leads to: which pyramids can fill space beyond Plato. Outside: J.-P. Sydler, Comment. Math. Helv. 40 (1965) 43.
10. **The TRD as the rhombic dodecahedron's h partner**. Why near: the Rule of Halves (#57) and #93's Theorem C give the template. Leads to: the TRD DICTOnode in a paper; the rhombic dodecahedron on every stacking. Outside: W. G. Burgers, Physica 1 (1934) 561.
11. **#53 Observation 1 (diagonal swap)**. Why near: switch points of power diagrams are flips of regular triangulations (Edelsbrunner–Shah, below). Leads to: a general switch theorem for the bonds. Outside: F. Aurenhammer … Algorithmica 15 (1996) 223.
12. **The golden split in the other AXE networks (#48)**. Why near: the method and uniqueness theorem exist. Leads to: new convex pairs. Outside: *none found yet: a search target*.
13. **Archimedean stretches (#49)**. Why near: the Polyhedral Stretching Theorem covers every equal-edged solid; listing and prior-art check remain. Leads to: new equal-edged solids. Outside: *none found yet: a search target*.
14. **The loose step O ⊂ rTI (#35)**. Why near: a golden-cut station of #91 may fit it (unsure). Leads to: the Vajrayana cycle complete. Outside: P. P. Dechant … J. Phys. A 45 (2012) 285202.
15. **Joining the fill thread to the cuts and the sweep**. Why near: #89 §7 and #93 are already fillings by the sweep's pieces. Leads to: #47 questions 1 and 3; the isolated fill thread tied in. Outside: J. T. B. Overvelde et al. … Nature 541 (2017) 347; J. B. Berger … Nature 543 (2017) 533.

5.3 Open points left by the papers

Of about 60 open points stated in the papers and studies, 9 are closed by later papers (among them #77 and #44 face to face by #92, #38 by #38a and #39, #48 by #51, #56 by #57). The rest are listed here.

Paper	Open point	Status
#92, #93	reversed neighbour of the T and C6 pyramids; undecided rows of #92 Table 2; tilings not face to face (#93: 7 edge and 3 face combinations); TRD centre pyramids	open
#38a	do its shells fill by one pattern	open
#48	golden split in the other AXE networks; printed keyed sets	open
#35	closing solid for the loose step O ⊂ rTI; the 9/φ⁴ coincidence; a physical build	open
#36	golden fill G′ of the bcc gap	paused
#36	golden Bull-horns adaptor; rhombic division of the 72-piece gap; Cleo-Ico adapters; oblique layers at the seams	open
#30	spine = thinned cut-and-project chain; seams as model sets; off-plane core rings; other solids with five inscribed cubes	open
#40	space DBT and OTT leave on mixed stackings; OG on aperiodic stackings with diffraction	open
#41	third level of Hexas; physical puzzle	queued
#42	what fills between the great star and the Sunstar	open
#43	Conjectures 1 and 2; shell 5 exact; the full flip	open
#43	shell ratios against Tsai clusters and virus capsids	queued
#45	Conjecture 1 (largest width)	open
#47	C + T + O without connectors; smallest kit; face to face; periodic in three directions	open
#49	Archimedean stretches and caps; prior art for the five-fold stretch	open
#50	catalogue of perfect points; which dissection fillers (Hill, Sommerville, Goldberg) the moves reach	open
#51	one solid per bond that fills alone; printed Samson and Delilah	open
#52	scale anomaly; web of the keyed bond	open
#53	Observations 1–4; exact walks of three-kind networks; a common reason for the switch points	open
#54	a shorter run as a classical gnomon; capped cubes at other sizes	open
#55	weight walks of σ, Z, C15 and other Frank–Kasper phases; 4D two-kind walks	partly queued
#56, #57	self-keyed Blockhead; three-kind walk; keyed Chucky and Fang	open
#61	Swap Rule for s < 1/4	open
#66, #67	Hexagonality Law for the Laves big atom on every stacking (exact to 6 layers)	open
#74	Loop Equality for all lengths (to length 34)	open
#76	exact atlas in Q(√5); proof of part (3)	open
#78	why the prime 89; matching the dodecahedra to the Red Queen's nine layers	open
#80	proof that Archimedean chains close in four steps; omnitruncates; the quasi-regular formula	open
#80, #81	exact edges of the open windows (cube s 49/80–59/80; dodecahedron 87/80–99/80)	open
#86	proof over whole stretches (exact at 402 weights)	open
#87	other centres for solids of low symmetry	open
#87	cardboard sheets for the other solids	queued
#91	Lemma 6 in general; off-base prism sections; exact stations of the tilted slice; TRD outside the cubic sweep; the factor 2 between 342 and 171	open
#89, #91	sections of the ten Schläfli–Hess star polytopes	queued
#90	structure over Q(√2, √5) beyond natural projections	open
#8	database search for the 1b + 12j point set	open
#62	six all-triangle 600-cell slices (28, 30, 32, 42, 48, 72 vertices); equilateral forms of five patterns	open

5.4 Weak joins

- Concepts in one paper only: Window Law (#84), tower move (#86), knitting slice (#83), Vacuus (#87), field obstruction and cut equals shadow (#90), polyhedral stretching (#49), lattice moves (#50).
- Cross-links still only suggestive: #48 ↔ #55 (one pyritohedral family at t = φ, φ², 2); #89/#91 ↔ #51/#53/#57 (the tesseract slice meets the fluorite lane only at the octet); #43 Conjecture 2 ↔ #80 (constant 3); #12 ↔ #38a.

- Threads that share no paper and no concept: fill with kepler, cycles, og, bonds, stack, queens, cuts and sweep; kepler with queens. The fill thread is the isolated one, partly a matter of tagging (#89 §7 and #93 are fillings).

5.5 From elsewhere: what other fields hold

Results from other fields, under other names, that bear on the threads and are not cited in any paper. Kind: **credit**, earlier or parallel work to cite; **test**, a check to run in the engine; **lead**, a direction to follow; **anchor**, the same mathematics in a real object or measurement. The strongest: the big bang billiard is the one triangle at p = ∞, so the ladder runs sphere (p = 3, 4, 5), plane (6), hyperbolic (7 and up), big bang (∞); the numbers 2 cos(π/p) are measured particle and anyon dimensions; and diamond growers' shape dial is α = 3/μ, our core turn.

Metallurgy	W. G. Burgers, Physica 1 (1934) 561	The bcc → hcp path, companion of Bain's fcc ↔ bcc.	bonds (#56, #57)	credit	to fetch	secondary	to read
Art and stellation	Escher's solid (M. C. Escher, Waterfall, 1961; G. W. Hart, The polyhedra of M. C. Escher)	The first stellation of the rhombic dodecahedron fills space alone.	kepler (DICTO Jewel fills)	test	to fetch	secondary	to read
Islamic art: Persian tilings	P. J. Lu, P. J. Steinhardt, Decagonal and quasi-crystalline tilings in medieval Islamic architecture, Science 315 (2007) 1106, doi:10.1126/science.1135491	Five decorated girih tiles built the strapwork patterns; the Darb-i Imam shrine in Isfahan (1453) carries a nearly perfect Penrose-type quasicrystalline pattern, with a self-similar subdivision.	kepler and cycles (decagonal, golden inflation); periodic–aperiodic aim	anchor	to fetch	abstract; later critiques of the Darb-i Imam mapping exist	to read
Islamic architecture: muqarnas	Aboufadil et al., Acta Cryst. A 75 (2019) conference abstract; Dinçer, Korumaz, Yazar, Anatolian Muqarnas (ACM, 2024); Y. Turan, Symmetry: Culture and Science (2025); M. Dold-Samplonius, Centaurus 35 (1992), al-Kashi's measure of the muqarnas	The muqarnas is a layered tiling of space by a few concave units whose plan is a plane tiling; Anatolian Seljuk plans use square–rhombus (Ammann–Beenker type) tessellations.	pyr (layered units over a plane tiling); stack (layers); fill	lead	to fetch	abstracts / secondary	to read
Weaving and textiles	D. K. Washburn, D. W. Crowe, Symmetries of Culture (1988); Washburn, Crowe (eds.), Symmetry Comes of Age (2004), with B. Grünbaum on Peruvian textiles	The plane symmetry groups as a working method for woven and knotted patterns; the knot grid of a carpet is a square lattice, the kaleidoscopes $p = 4$ and the flat $p = 3, 6$ in cloth.	one triangle (plane groups); 2D kaleidoscope worlds	lead	to fetch	secondary; no source on carpet knot grids found	to read
Music theory	D. Tymoczko, The geometry of musical chords, Science 313 (2006) 72; the Tonnetz (Euler 1739, Riemann)	The Tonnetz is the triangular lattice, our flat triangle $p = 6$; chord spaces are orbifolds, spaces folded by mirrors, i.e. kaleidoscopes.	one triangle ($p = 6$); stack (the triangular layer)	lead	to fetch	secondary	to read
Waves and resonance	A string of $p - 1$ equal beads (the path graph, which is also the Coxeter diagram $A(p-1)$): its highest vibration has frequency number $2\cos(\pi/p)$	So the mirror numbers $1, \sqrt{2}, \varphi, \sqrt{3}$ of the one triangle ($p = 3, 4, 5, 6$) are the top resonances of strings of 2, 3, 4, 5 beads.	one triangle	anchor	to fetch	checked (eigenvalues, exact formula $2\cos(k\pi/p)$)	to read
Waves: spherical harmonics	“Spherical harmonics and the icosahedron”, arXiv:0706.0088; P. J. Steinhardt, D. R. Nelson, M. Ronchetti, Bond-orientational order in liquids and glasses, Phys. Rev. B 28 (1983) 784	Icosahedral symmetry allows spherical harmonics only of degrees $6p + 10q$ and $6p + 10q + 15$ (first at 6); the degree-6 measure Q6 detects icosahedral order in liquids and glasses. Tested 4 November 2026 (study 2026-11-04-harmonic-fingerprint): on the cube–octahedron sweep the cubic part Q4 vanishes only at Icosaxes, $\mu = \varphi$ (exact: $a^4 - 3a^2 + 1 = 0$), whose 24 corners are two icosahedra.	cycles, og, queens (harmonic fingerprint of the nests)	test	to fetch	abstract; Steinhardt et al. standard	tested

Fields not yet consulted, named by the search: dislocation theory (each h ↔ c swap is a partial-dislocation glide); commensurate–incommensurate transitions; semi-discrete optimal transport (the weight walk); martensitic paths (Burgers, Kurdjumov–Sachs); topological

interlocking and architected materials; realisation spaces of polytopes; hypersimplices (the octahedron is Δ(2, 4)); fulleride and cluster chemistry; multiply-twinned nanoparticles; hyperbolic tilings and holography.

Notes on this version

- Version 1, 4 November 2026. Sources: every paper.src.html (else paper.html) in papers/, the paper cards of dictospheres.com, the DICTOnary atom cards and the cross-links audit of 4 November; papers to #94. Each new paper, read or test is one edit to concordance.json and a rebuild; new versions are batched.
- Not yet covered: the books as entries of their own; the findings F1–F21 except where a paper, card or DICTOnary entry names them; the Kaleidohedra app Almanac (alm.c.*), whose concept ids these could feed later; every piece of every kit (only pieces with a name are listed).
- To check (threads): the seed list of the four-dimensional queens named #64, which is The Swap Rule in Crystals; it is replaced here by #62 and #63. There is no card numbered #82, #46 or #21.
- To check (dates): for #8–#38a the local texts carry only the date of their current version (20 October 2026, the licence change); #1–#20, #27 and #31a–#35b have no text of their own in papers/ (findings, book chapters or short records): their lines come from the site cards.
- Names: every name is DICTO's choice unless a paper says otherwise (DICTO, 4 November 2026). Fallen Humpty (D102): the DICTOnary gives #62, the name is also in #63. Golden Clasp (D107) first appears in a study, not a paper.
- Name clash: “golden tetrahedra” of #38a (Danzer, Mosseri–Sadoc) are not the Golden Cut Tetrahedra of #88/#89. The TI Star core (D105) is cut at $(10 - \sqrt{5})/19$ of each edge (#78 version 3); the DICTOnary draft is corrected, the published Golden Cycle and Star Cores books at their next versions.
- To check (the triangle): the placement of each thread on page “The Singularity” is the compiler's reading of the papers, for DICTO to confirm.
- Part 5B: every outside find was checked against its abstract or a reliable record (column “checked”); none is yet read in full, all stand “to read”. Unrefereed preprints found by the search are left out. Library copies: only Hermann is held so far.
