Quanta of Space

A Manifesto

Is space smooth, or built from exact pieces that fit with no gaps? From the atoms of Democritus and Plato's kit of solids to the quanta of modern physics, this manifesto follows that question through 68 works by DICTO, in six chapters: Atoms, Bonds, Shells, Cycles, Stacking and Four dimensions.

Its centre is the Rule of Halves: however equal balls are stacked in close-packed layers, the space between them is shared out into pieces of only finitely many kinds, a finite catalogue of quanta for every close packing, which closes into two tiles, HexOct. The book ends Chapter 1 with the catalogue of all the atoms: DICTO's 102 numbered shapes and his 31 new clusters, structures and networks.

DICTO is an artist in Osaka, Japan, with a background in architectural sculpture, stonecarving and Buddhist statuary. He builds geometric sculpture from recycled PET bottles with his own modular systems, B1NR and DICTOspheres.
