Star Cores

Spikes, Halos and Cycles

Cut a solid from its centre into pyramids, one on every face, and turn them outwards: the solid becomes a star. Wrap the star in its tightest skin and a larger solid appears, its halo. This book gives every one of DICTO's new shapes this star core treatment. With each spike's tip at the pole of its face, the space between star and halo always fills with one pyramid over each corner and one tetrahedron over each edge, for every convex solid: the thick form of Conway's join.

Turn after turn, the cores of most shapes settle into a pair that swaps back and forth, and the stars' growth rule, run on its own, closes into cycles whose exact gains follow the shape's symmetry. Built upon again, with shorter spikes in the valleys, the symmetric stars freeze into finished forms while the eccentric pieces keep growing.

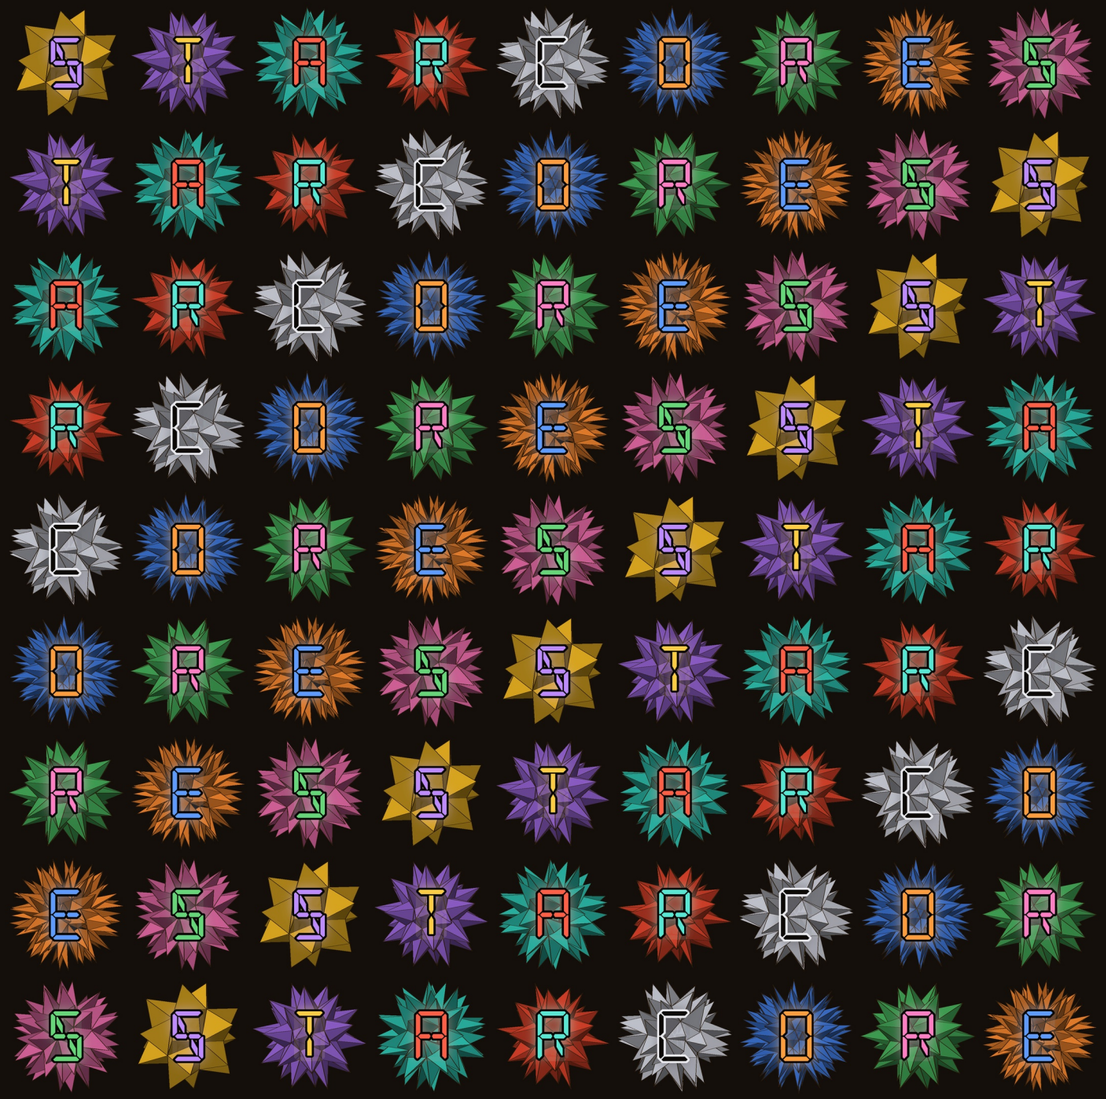

DICTO is an artist in Osaka, Japan, with a background in architectural sculpture, stonecarving and Buddhist statuary. He builds geometric sculpture from recycled PET bottles with his own modular systems, B1NR and DICTOspheres. He is also the author of HexOct: The Hexagonality Law, Alicia in Wonderland, The Golden Cycle and Quanta of Space: A Manifesto.
